                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the prin specification, but was obtained in electronic format directly from WI at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention
                                                                         Immunosuppressive; allograft rejection; topological parameter; physico-chemical parameter; in silico screening; pharmaceutical; cosmetic; agrochemical; biomaterial; veterinary application.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                                                                         The present invention relates to a method for identifying physico-chemical and/or topological parameters associated with biological activity. The method involves selecting the first subset from the method involves selecting the first subset from predetermined set of physico-chemical parameters, determining their value of function, and selecting the second subset from physico-chemical parameters based on the values of function, such that each second subset is more closely associated with the activity than the first subset. The selected physico-chemical parameters are useful for developing criteria is more closely associated with the activity than the first subset. The selected physico-chemical parameters are useful for developing criteria for screening of compounds. The compounds may be used in pharmaceuticals, cosmetics, agrochemicals, biomaterials and in veterinary applications. It is also useful as an antibiotic or antifungal agent. The present sequence is an immunosuppressive peptide, pls, identified by in silico screening. The immunosuppressive peptide, the peptide that prevents allograft rejection is tested in a heterotopic allograft model of mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The present sequence is a peptide which may be used in a method for inhibiting activation of cytotoxic T lymphocytes and/or natural killer cells. The method involves combining the cells with a compound comprising an oligopeptide of at least 6 anino acids comprising a contiguous sequence of a human leukocyte antigen (HLA)-B alphal domain including amino acids 84-86 are YYW. The method is useful for transplanting a donor mammalian organ or cells to a mammalian recipient. The organ or cells are combined with the compound prior to implanting in the mammalian recipient, or the compound may be administered to the mammalian recipient, or the compound from prior to implanting the donor organ or cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a peptide which may be used in a method for inhibiting activation of cytotoxic T lymphocytes and/or natural killer cells. The method involves combining the cells with a compound comprising an oligopeptide of a Least 6 amino acids comprising a contiguous sequence of a human leukocyte antigen (HLA)-B alphal domain including amino acids 84-86, where amino acids 84-86 are YYW.
Inhibiting activation of cytotoxic T lymphocytes and/or natural killer cells involves combining cells with compound comprising oligopeptide with contiguous sequence of human leukocyte antigen-B alphal domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibiting activation of cytotoxic T lymphocytes and/or natural killer cells involves combining cells with compound comprising oligopeptide with contiguous sequence of human leukocyte antigen-B alphal domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; human leukocyte antigen-B; HLA-B; immunosuppressive; cytotoxic T cell activation inhibition; cell transplantation; natural killer cell activation inhibition; organ transplantation.

                                                                                                                 inhibiting activation of cytotoxic T lymphocytes and/or natural killer cells. The method involves combining the cells with a compound comprising an oligopeptide of at least 6 amino acids comprising a contiguous sequence of a human leukocyte antigen (HLA)-B alphal domain including amino acids 84-86, where amino acids 84-86 are YYW. The method is useful for transplanting a donor mammalian organ or cells to a mammalian recipient. The organ or cells are combined with the compound prior to implanting in the mammalian recipient, or the compound may be administered to the mammalian recipient in a period extending from prior to implanting the donor organ or cells.

                                                                                                                                                                                                                                                       cells. The method involves combining the cells with a compound comprising an oligopeptide of at least 6 amino acids comprising a contiguous sequence of a human leukocyte antigen (HIA)-B alphal domain including amino acids 84-86, where amino acids 84-86 are YYW.

The method is useful for transplanting a donor mammalian organ or cells to a mammalian recipient. The organ or cells are combined with the compound prior to implanting in the mammalian recipient, or the compound may be administered to the mammalian recipient in a period extending from prior to implanting the donor organ or cells.

                                                                                                                                                                                                                                                                          AAR83061-R83085, AAR83090-R83096 and AAR92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched domor. The peptides are administered to a patient in conjunction with a subthersapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLS)
        Cytotoxic T lymphocyte, CTL, major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

This sequence represents a specifically claimed immunomodulating dimer peptide of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal caylated and/or C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-771) (aa79-64) or (aa84-79) (laa77-768); aa76 = B or V, aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a hydrophobic or small amino acid, aa82 = R or L; aa83 = G or R; and as represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the profiferation of reals in response to anti-CD3. The peptide can be used for preventing rejection of transplants and lupus erythematosis. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; immune; haematopoietic; immune/haematopoietic antigen; cancer; cytostatic; gene therapy; vaccine; metastasis.

```
proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to produce the secreted (I), by inserting protein. (I) proteins and polynucleotides may be used to prevent and culturing the cell to express the diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK5492 to AAK54950 and AAM8169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  56.9%;

New peptide YY analogs especially useful for treating gastrointestinal disorders associated with excess intestinal electrolytes and water secretion, and decreased absorption, e.g. infectious and inflammatory diarrhea

Claim 24; Column 5; 18pp; English.

Sequences AAY87551-Y87564 and AAY87568 represent novel analogues of peptide YY (PYY) that can be used for the treatment of gastrointestinal disorders. PY (AAY87549, AAY87550) is a 36 residue peptide amide that is released into the circulation after a meal and which is thought to play a role in regulating intestinal secretion and absorption. It binds

to a receptor on intestinal epithelial cells, and inhibits intestinal secretion and gut motility. It is therefore a natural inhibitor of diarrhoea. Pry has also been implicated in nutrient uptake, cell corporation. Iipolysis and vasoconstriction. The compounds of the invention are useful for inhibiting fluid and electrolyte secretion in the sugmenting nutrient transport; increasing cell corporates are useful for inhibiting fluid and electrolyte secretion in the gastrointestinal tract; regulating injolysis in, corporated with excess intestinal blood flow in mammals. The analogues are especially useful in the treatment of gastrointestinal disorders associated with excess intestinal electrolytes and water corporated with excess intestinal electrolytes and water secretion, as well as decreased absorption. For example, they are useful in treating acute viral or bacterial diarrhoea, diarrhoea due to protozoal infections, travellers' diarrhoea, diarrhoea due to protozoal infections, travellers' diarrhoea; inflammatory diarrhoea (e.g., Crohn's disease, irritable bowel syndrome); short bowel syndrome; or diarrhoea following ileostomy. The peptides can also be used to treat diseased. A service of the pry analogues are shorter than naturally occurring PPY, synthesis and purification of the compounds is easier and less costly. The analogues interact specifically with PTY receptors and not with receptors for the pry homologue neuropeptide Y (NPY), thus minimising unwanted ö Gaps .; 0 DB 21; Length 10; 12; 0; Indels 55.2%; Scor. 100.0%; Pred. The sequences of the invention are useful for diagnosing a protective sequence-mediated condition, disorder or disease in an individual. The treatable disorders are preferably of the central nervous system of humans including ischaemia-related conditions such as stroke, cerebral herniation, septic embolism, cerebral oedema, infections such as meningitis, protozoal infections such as malaria, metazoal infections such as echinococcosis, vascular diseases such as ischaemic encephalopathy, conditions involving the eye such as macular degeneration, diabetic retinopathy, trauma such as epidural haematoma, tumours such as primary intracranial tumours, degenerative diseases such as Alzheimer's disease and nutritional, environmental and metabolic conditions. Sequences AAU73255-AAU73378 represent open reading frames of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; EIISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                            Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful :

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central
                                                                           Inhibiting activation of cytotoxic T lymphocytes and/or natural killer cells involves combining cells with compound comprising oligopeptide with contiguous sequence of human leukocyte antigen-B alphal domain -
                                                                                                                                                                                                                                                                                                                                                                                                                               Human; human leukocyte antigen-B; HLA-B; immunosuppressive; cytotoxic T cell activation inhibition; cell transplantation; natural killer cell activation inhibition; organ transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form specification, but was obtained in electronic format
                                                                                                                                               WPI; 2001-111720/12.
                                                                                                                                                                                                                                               03-MAY-1995;

```

The present sequence is a peptide which may be used in a method inhibiting activation of cytotoxic T lymphocytes and/or natural

tor killer

ö

```
cells. The method involves combining the cells with a compound comprising an oligopeptide of at least 6 amino acids comprising a contiguous sequence of a human leukcyte antigen (HLA) Balphal domain including amino acids 84-86, where amino acids 84-86 are YYW. The method is useful for transplanting a donor mammalian organ or cells to a mammalian recipient. The organ or cells are compined with the compound prior to implanting in the mammalian recipient, or the compound may be administered to the mammalian recipient in a period extending from prior to implanting the donor organ or cells.

This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The newel derivatives are linear and lack the genet to an organism, e.g. therapeutic proteins, antibodies for their fragments), nucleic acid, oligonucledtides, ribozymes, antitumour agents antivirals and anti-inflammatories, etc. The derivatives are non-toxic mechanism, so can deliver active agents to cytoplasm and non-live active agents including crossing the blood-brain barrier. Derivatives of antibiotic peptides lacking disulfide bridges as carriers to deliver active agents into cells Claim 7; Page 28; 37pp; French.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mak P., Wojcik K., Thogeren 1.B., Dubin A.;
"Isolation, antimicrobial activities, and primary structures of hamster neutrophil defensins."
"Isolation, antimicrobial activities, and primary structures of hamster neutrophil defensins."

"Infect. Immun. 64-4444-449(1996).
-!- FUNCTION: BACTERICIDAL ACTIVITY, GREATER AGAINST GRAM-POSITE BACTERIA. LOW ANTI-FUNGI ACTIVITY.
-!- SIMILARITY: BELONGS TO THE CORTICOSTATIN/DEFENSIN FAMILY.
-!- CAUTION: THE HANP-2 COULD BE A PRODUCT OF PROTEOLYTIC N-TERMINAL AMINO ACID REMOVAL FROM HANP-4.

Immun. 64:444-4449(1996).
-!- FUNCTION: BACTERICIDAL ACTIVITY, GREATER AGAINST GRAM-POSITE
BACTERIA. LOW ANTI-FUNGI ACTIVITY.
-!- SIMILARITY: BELONGS TO THE CORTICOSTATIN/DEFENSIN FAMILY.
-!- CAUTION: THE HANP-2 COULD BE A PRODUCT OF PROTECLYTIC N-TERMINAL
AMINO ACID REMOVAL FROM HANP-4.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

HLA-B2702 CTL modulating peptide (B2702.84-75(T)/75-84(T)). (STRD ) UNIV LELAND STANFORD JUNIOR. AAR92910 standard; peptide; 20 AA. 95WO-US04349 94US-0222851 16-MAY-1996 (first entry) W09526979-A1. 05-APR-1995; 05-APR-1994; 12-0CT-1995. Synthetic. AAR92910; RESULT 1 AAR92910 

AAR83061-R83085,

AAR83090-R83096 and AAR92907-R92913 represent fra histocompatibility complex (MHC) antigens. This

fragments

Example 15; Page 36; 80pp; English

of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S X
                                                  CC immunomodulating activity. A peptide-type compound or variant is claimed CC which has immunomodulating activity, including the N-terminal acylated CC and/or C-terminal amidated or esterified forms of up to 60 amino acids, CC where the peptide-type compound comprises the formula; A-B, where A, B = CC (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = CC D, S or N; aa79 = R or G; aa80 = I or N; aa81 = a bydrophobic or Small amino acid; aa82 = R or L; aa83 = G or R; and a represents amino acid. The sequence in the brackets may optionally be absent or truncated CC amino acid sequences related to a Class I HLA-B alphal domain (positions CC 19-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from CC used in combination with antigenic apptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection CC fransplants or for treating autoimmune diseases, e.g. diabetes, CC used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is an immunomodulatory peptide, which comprises a class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                   1..10

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           impunomodulating activity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal activity, including the N-terminal acylated and/or C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-771) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, S or N; aa92 = R or G; aa80 = 1 or N; aa81, aa84 = a hydrophobic or acid. The sequence in the brackets may optionally be absent or truncated acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise an ino acid sequences related to a Class I HLB alphal domain (positions 79-84). They can be used to inhibit cytocoxic T-lymphocytes (CTL) from undeasirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatcoid arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.

                                                                                                                                                                                                                                                                                                                                5
                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is an immunomodulatory peptide, which comprises a Class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic doing of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of function, and selecting the second subset from physico-chemical parameters, determining their value parameters based on the values of function, such that each second subset is more closely associated with the activity than the first subset. The selected physico-chemical parameters are useful for developing criteria for screening candidate molecules and are suitable for use in silico screening of compounds. The compounds may be used in pharmaceuticals, cosmetics, agrochemicals, biomaterials and in veterinary applications. It is also useful as an antibiotic or antifungal agent. The present sequence is an immunosuppressive peptide, 2702.475 (also referred as D2702.75-84), identified by in silico screening. The immunosuppressive activity of the peptide that prevents allograft rejection is tested in a heterotopic allograft model of mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HLA; p74; alpha1-helix; human-leucocyte-associated antigen; inhibitor; T-cell lysate; membrane protein; mammal; heat shock protein; Hsc70; AI B cell; calcium influx; cytotoxic T lymphocyte; CTL; differentiation;

AAR95413, and AAR95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the human-leucocyte-associated antigens. This sequence can be used to isolate the protein p74 from a T-cell lysate. P74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Haso70. P74 is found in a limited number of cell types, but is particularly expressed on B and T cells. P74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60-44 (see AAR95416), induces calcium influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and chermining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular containing T-cells and antigen presenting cells (APCS), by adding the mix the actracell so the part of the compound and containing T-cells and antigen presenting cells. adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand Score 22; DB 16; Length 20; Pred. Extension of acceptance period of transplants from MHC unmatched donor hosts - using Class I B75-84 MHC antigen of the recipient Clayberger C, Krensky AM, Parham P; (STRD ) UNIV LELAND STANFORD JUNIOR. Example 15; Page 36; 80pp; English. 95WO-US04349, 94US-0222851 WPI; 1995-358582/46. 05-APR-1995; 05-APR-1994; 12-OCT-1995. 

AAR83061-R83085, AAR83090-R83096 and AAR92907-R92913 represent fragments of class I major histocompatibility complex (WHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the

Compsns. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLs.

                                                                                                                                               AAR83061-R83085, AAR83090-R83096 and AAR92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        period of acceptance by a recipient of a transplant from an MHC unmatched donor.                                                                                                                                                                                                                                                                               AAR83061-R83085, AAR83090-R83096 and AAR92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B7. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B7.

This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapettic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLS)
          Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

This sequence represents a specifically claimed immunomodulating dimer peptide of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = B or V; aa37 = L). S or N; aa79 = B or G; aa80 = I or N; aa81, aa84 = B or V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = B or V; aa87 = D, S or N; and aa represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cyctoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in virtor They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proteins of interest to activate CTLs. They can also inhibit the proteins of for preventing rejection of transplants or for treating autoimmune and the process of the preventing autoimmune and the process or the process of the preventing rejection of transplants or for treating autoimmune and the process or the process of the preventing rejection of transplants or for treating autoimmune and the process or proces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunomodulating dimer; immunosuppressant drug; CTL activation;
transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                               New immunomodulating dimer peptide(s) - based on a Class I HLA-B alpha-1 domain, used for preventing rejection of transplants or

                                                                                                                      S
                                                                                                                                                                                                                                                 This sequence represents a specifically claimed immunomodulating cdimer peptide of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal cc acjuated and/or C-terminal amidated or esterified forms of up to 60 cc amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or C; v; aa77 = D; S or N; aa79 = R or G; aa80 = I or N; aa81 = aa84 = a cc hydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and aa represents amino acid. The sequence in the brackets may optionally be cabsent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B calphal domain (positions 79-84). They can be used to inhibit cytotoxic CT -lymphocytes (CTL) from undesirably attacking cells in a host or in CC proteins of interest to activate CTLs. They can also inhibit the products or preventing rejection of transplants or for treating autoimmune classes, e.g. diabetes, rheumatoid arthritis and lupus erythematosis.
                                                                                                                                                              Query Match 71.0
